TIER III : Nucleon Matter (Layer N)
Scale: $\approx 10^{-15}$ m | Toroidal Phase Vortex

Thread A : Projection of Action (h)

Geometric Form: **Topological Torus**
Form Factor = 2π

Conservation of h :

$h_{\mathrm{S}} \to h_{\mathrm{D}} \to h_{\mathrm{N}} \to h_{\mathrm{obs}}$

Geometric factor increases precisely as Torsional Invariant (J_i) decreases, perfectly conserving absolute Action.

Geometric Form: **Solid Sphere**
Form Factor = $\frac{4}{3}\pi$

Geometric Form: **Radial Vector**
Form Factor = 1

Invariant Action

$h_i = (\text{Geo Factor}) \cdot J_i c_{\mathrm{E}}$

Phase Structure
Solid Node +
Interstitial Condensate

Invariant Gravitational Constant

$G_i = (\text{Form Factor}) \cdot \dfrac{c_{\mathrm{E}}^2 A_{\mathrm{S}}}{J_i}$

TIER II : Soft Floor Vacuum (Layer D)
Scale: $\approx 10^{-26}$ m | Soft Spherical FCC

TIER I : Latent Substrate (Layer S)
Scale: $\approx 10^{-35}$ m | Rigid Hard SC Lattice

Thread B : Projection of Gravity (G)

Coupling: **Toroidal (Vortex)**
Form Factor = 1.0
Torsion: $J_{\mathrm{N}} = J_{\mathrm{D}}/1.5$

The Impedance Match :
$\mathbf{J_N \equiv J_S}$

Matter is a superconductive channel that tunnels directly to the Hard Floor.

Coupling: **Spherical Surface**
Form Factor = 1.5

Coupling: **Self (Absolute)**
Form Factor = 1.0

Fundamental Definitions

Torsional Invariant: $J_i = \rho_i r_i^4$

Absolute Substrate Area: $A_{\mathrm{S}} = \ell_{\mathrm{S}}^2$

Invariant Elastic Capacity: c_{E}
